

Report of the Committee of the Statisticians, constituted by Kerala Public Service Commission, to study the standardization procedure for Degree Level Common Preliminary Examinations, 2026 (conducted on 02.05.2026, 16.05.2026 and 06.06.2026)

The Kerala Public service Commission constituted the committee to standardize the marks obtained by candidates in preliminary examinations to short list candidates who secured marks above a cut off mark for the selection to the main examination. The preliminary examinations conducted on three different dates with different question papers based on the same syllabus.

One cannot determine which question is more difficult simply by reading the questions. It is not fair to decide a question is more difficult based on intuition or subjectivity of a person. The decision can be taken only based on empirical evidence.

So, the committee decided to compute the index of difficulty (difficulty level) of each question in each question paper. **The index of difficulty (p) of a question is defined as the proportion of correct answers of that question (that is the number of correct answers of the question divided by the total number of candidates who wrote the examination with the respective question paper) (Nitko (1996), Crocker & Algina, 1986).** The larger the proportion getting a question right, the easier the question. The higher the difficulty index indicates the easier the question and the lower the index of difficulty indicates the question is difficult. The index of difficulty will be always in between 0 and 1. **The index of difficulty ‘0’ means the maximum is the difficulty and ‘1’ means the difficulty is minimum.** The committee carried out an exploratory analysis on the marks of three phases. In order to compute the difficulty indices, the performances of the top Forty percent candidates from each phase are taken. In each question paper, the difficulty index of all questions are computed and classified into ten categories based on the number of correct answers of each question.

The questions in each question papers are to be divided into ten strata as follows:

Stratum No.(j)	Range of difficulty index(p)
1	$0 \leq p \leq 0.1$
2	$0.1 < p \leq 0.2$
3	$0.2 < p \leq 0.3$
4	$0.3 < p \leq 0.4$
5	$0.4 < p \leq 0.5$
6	$0.5 < p \leq 0.6$
7	$0.6 < p \leq 0.7$
8	$0.7 < p \leq 0.8$
9	$0.8 < p \leq 0.9$
10	$0.9 < p \leq 1.0$

The Committee analyzed the performances on each question of the question papers for standardization and illustrated with data. The Committee was of the opinion that the effect of standardization should be same for all candidates who scored the same mark within a particular group (answered a particular question paper) because the weightage of all questions were same while conducting the examination. Also it is not fair to give the same benefits of difficulty for all in a phase because the difficulty level of candidates within a phase may be different due to various reasons. So, the committee decided to give the benefits of difficulty proportional to the performance of the candidates. The committee unanimously suggests the following procedure for standardization.

All questions in a question paper are to be stratified into ten levels as given above. Then a score of difficulty (DS) is to be computed for each question paper as given below.

$$\text{Compute } DS_i = \sum [N_{ij} \times (1 - M_j)] / N_i ; i=1,2,3: j=1,2,...,10$$

Where DS_i is the score of difficulty for the i^{th} question paper; N_{ij} is the number of questions in the j^{th} stratum of the i^{th} question paper, $(1 - M_j)$ is the median difficulty level of the j^{th} stratum ($M_1=0.05$, $M_2=0.15$, $M_3=0.25$, $M_4=0.35$,

$M_5=0.45, M_6=0.55, M_7=0.65, M_8=0.75, M_9=0.85, M_{10}=0.95$), N_i is the number of correct questions in the i^{th} question paper.

Then the proportion of difficulty (PD) of each question paper to the lowest difficult question paper (DS_i is minimum) can be computed as:

$$PD_i = (DS_i / DS_{min})$$

PD_i is the proportion of difficulty of the i^{th} question paper to the lowest difficult question paper; DS_{min} is the score of difficulty of the question paper which has the minimum DS.

Then the final mark of the j^{th} candidate who attended the i^{th} question paper (S_{ij}) is to be computed as:

$$S_{ij} = \text{Min}[100, M_{ij} \times PD_i]$$

Where M_{ij} is the mark actually scored **out of 100** (including negative marks) by the j^{th} candidate in the i^{th} group.

=====

Note:

1. All the marks may be corrected to a convenient number of decimal places to break tie.
2. The standardization procedure depends on the nature of data, hence the above said procedure cannot be applied to another situation without exploring the feasibility of the method.

Table 1: Number of questions in each stratum among the two phases

Phase	Stratum										Total
	1	2	3	4	5	6	7	8	9	10	
1	12	11	10	10	8	7	10	15	13	2	98
2	12	11	15	9	9	5	15	6	7	6	95
3	13	5	14	8	10	13	12	8	8	4	95

Table 2: Multipliers

Phase	DS	Proportion of Difficulty Multiplier (PD)
1	0.526531	1
2	0.559474	1.06257
3	0.539474	1.02458

Table 3: Method of calculating actual marks from the marks awarded after standardisation.

$$\text{Actual marks scored (i.e., before standardisation)} = \frac{\text{Marks awarded after standardisation}}{\text{Proportion of Difficulty (as in Table 2)}}$$

For example:

Phase	Marks awarded after standardisation (available through profile)	Actual marks scored (i.e., before standardisation, out of 100)
I	51	(51.00/1.0) = 51.00
II	51	(51.00/1.06257) = 47.99
III	51	(51.00/1.02458)=49.77

I	60	(60.00/1.0) = 60.00
II	60	(60.00/1.06257) = 56.46
III	60	(60.00/1.02458) = 58.56
